

Empowering Everyone — Local Commerce, Bottom Up

WebServing.com | EmpoweringEveryone.com | WebClerk.com

The Problem

A customer searches for a product online. Amazon shows it from a warehouse 800 miles away. The hardware store 3 miles away has 12 on the shelf — but that inventory is **invisible to the web**.

Two things happen every time Amazon wins that search:

- **Resources drain from the local economy.** The sale, the tax revenue, the job — all leave the community.
- **Customer relationships are surrendered to Amazon without compensation.** The local store loses not just the sale but the customer. Amazon owns the relationship now.

Centralized Marketplace	Desktop Hosting
15–30% marketplace fees	Zero marketplace fees
You rent your storefront	You own your storefront
Your data belongs to them	Your data stays on your machine
Your customers belong to them	Your customers are yours
Race to lowest price	Compete on service and proximity

The Solution: Desktop Hosting + WebServing

Every business runs its own commerce system on its own hardware. Not rented from a cloud. Not dependent on a marketplace. **Sovereign.**

WebServing.com is the routing layer — when a customer searches, it queries every local store within 1–10 miles and returns what's in stock, with prices and distances. No central catalog. No marketplace fees. WebServing is the router, not the owner.

Getting started — 4 steps:

1. **Install WebClerk** — free, open source (github.com/JPods/WebClerk)
2. **Get a domain** — Cloudflare or Hostinger (~\$10/year), point it at your machine
3. **Buy a Mac Mini or IT15** — 24+ GB RAM (\$1,500–\$1,900)
4. **Load your inventory** — link your system or upload. AI assists. Free HQ support for 2 months.

You are now web serving your own data from your own server. No middleman. No giving your customer relationships to Amazon.

The Economics

	Cost	vs. Amazon/Shopify
Marketplace fees	\$0	Amazon: 15–30% per transaction
AI assistance	\$14/month (5 staff)	Shopify: \$79–399/month
Hardware (one-time)	~\$1,700	Both own your customer relationship

Every feature available to everyone. No enterprise tier. No feature gates. Large companies run multiple sovereign installations — each location pays only for its own staff.

Why This Matters

The individual is sovereign. Institutions are agents with limited, enumerated, revocable permissions. — Divided Sovereignty

You own the hardware. You own the data. You own the customer relationship. WebServing.com finds your inventory for customers — it never touches your data, never takes a cut, never controls your listing. Power distributed, not concentrated.

The network effect works for everyone. Every store that joins makes the network more useful. More inventory visible means more searches succeed. More customers find local stores. More stores join. The network grows because it serves its members — not because it traps them.

Apple and the Mac Mini. Every local business running WebClerk on a Mac Mini is a hardware sale. Apple gets a sovereign commerce network competing with Amazon — without building or owning it.
